Introduction

myCar is a small project to create a embedded device for obdgpslogger. It is made of some cheap parts which could be found in the hardware section.

> In 2018 I baught a Citroen C3 Picasso from 2010 with about 85000 km as a

History

To check the ECU error codes with my Linux devices I've found a real cool tool called obdgpslogger. It seemed to me that this is the right tool to have long time analysis of the engine behaviour to debug defective parts.

Allthough its clear to me that there are APPs around I've got a problem using my SailfishOS for such stuff, because the only available tool OBDFish is not working properly with my ELM327 Bluetooth dongle.

So I started to use obdgpslogger. But its quite uncomfortable to me to use a laptop for data aquisition. So my idea is to have a small embedded device like a OrangePI Zero (I've had one in spare) and enhance it for obdgpslogger.

To create some better user experience a frontend is needed and some automation so that the embedded device is automagically capturing data once it is powered up.

Et voilat myCar was born.
