abstract

The configuration page implements the main place to configure the system.

Sections

The configuration file is divided in sections. This is also represented in the configuration file.

paths

This sections provides some filesystem paths. You can enter them relative or absolut. Relative paths are relative from application root directory.

- **record** The path where obd databases are recorded. Should be some permanent storage.
- **app** Application root path. This path is used as relative root and should be absolut ideally.
- **log** The path where logfiles are stored. Ideally a tmporary storage in RAM

connections

A section for configuring connections to and from the system.

- **bt_dev** should point to the OBDII connection. If you're using an ELM327 with Bluetooth it will be mostlikely a /dev/rfcomm device
- **wifi_pwd** This system is designed with a wifi hotspot. Here you specify the WPA2 key.
- **gps_dev** specifies the GPS source. This is usually some kind of serial device. ttyS0 for example

startup

Controlls the startup behaviour of the system.

- **bt_connect** automatically connect to a specified bluetooth device after boot
- **autorecord** immediately start recording (start obdgpslogger) after boot. A connection to a OBDII dongle is required.
